

## Removing 928S rear bumper cover to replace taillights/clean/etc

**SOLUTION/FIX:** See picture for blue/red/green/yellow circles mentioned in writeup

- 1) Remove rear wheels and passenger side rear wheel well shield.
- 2) Undo wingnuts on rear sidemarkers from inside wheel well and hang lights outside of quarter panel.
- 3) BlueCircles: Phillips head screws removed from top where bumper cover meets hatch.
- 4) Red Circles: 8mm nuts removed from inside the wheel wells. (Soak in liquid wrench first)
- 5) Green Circles: 13mm (I think) nuts removed from underneath and behind bumper cover.
- 6) Yellow Circles: 19mm (I think) nuts LOOSENED from underneath bumperettes. (They don't need to be completely removed)
- 7) Bumper cover is now free. Pull out far enough to reach in and unclip harness for license plate lights.
- 8) Taillights are attached to bumper cover with 4 nuts, 2 on top 2 on bottom. i would suggest removing these when the bumper is completely off. Unclip the light harnesses from inside the hatch, behind the covers on each side and push harness through the frame.
- 9) With all harnesses unclipped and nothing going through the frame, the bumper cover with taillights attached is completely free.
